SOFTWARE USER MANUAL

Greek to Greeklish Renamer

Rename files and folders safely, without changing their contents.

EXAMPLE CONVERSION

Ελληνικά.mp3 → **Ellinika.mp3**

Only names containing Greek letters are considered for renaming.

What this manual includes

01 **Getting started** 2

Install Python, choose a directory, preview changes

02 **Renaming rules and safety** 3

Greek-only detection, folder options, conflict protection

03 **Undo and troubleshooting** 4

Restore original names, commands, and common problems

Created by Dimitris Laidis

MIT License | Python 3.10+ | Version 1.2.1

01 / QUICK START

Getting started

This lightweight Windows-friendly tool converts Greek filenames and folder names to Latin characters. It never changes file contents.

Requirements

Windows 10/11 and Python 3.10 or later. No additional Python libraries are required to run the renamer.

How to use it

01. Extract the ZIP, keeping rename_greek_to_greeklish.py and Run_Greek_to_Greeklish.cmd together.

02. Double-click Run_Greek_to_Greeklish.cmd.

03. Paste or drag a folder into the window, or press Enter to use the script folder.

04. Choose Y to include subdirectories or N / Enter for the selected folder only.

05. Review the proposed changes. Type YES to apply, or anything else to cancel.

BEFORE PROCESSING A LARGE FOLDER

Test with a few files first and back up important folders. Playlists and software referencing old paths may need updating.

02 / RENAME RULES

What changes and what stays

Only names containing Greek letters are candidates. Filenames already written in English/Greeklish remain unchanged.

ORIGINAL	RESULT
Γιώργος Μαζωνάκης.mp3	Giorgos Mazonakis.mp3
Δημήτρης Κόκοτας.flac	Dimitris Kokotas.flac
DJ Set - Ελληνικά.mp3	DJ Set - Ellinika.mp3
English Song.mp3	Unchanged

Built-in safeguards

- Preview and confirmation: nothing changes until you type YES.
- Existing Latin-only names are never overwritten.
- Conflicting names get a suffix such as (2), (3), etc.
- Subfolder processing is optional; symlinks and junctions are skipped.
- Completed renames are recorded in a CSV undo log.

ABOUT TRANSLITERATION

Rules are inspired by ELOT 743 / ISO 843. Accents are removed and some spellings are simplified.
This is not an exact or certified implementation.

03 / RECOVERY

Undo and troubleshooting

After renaming, the selected directory contains a CSV log named greeklish_rename_log_*.csv. Keep it to restore original names.

Undo changes

In PowerShell inside the script folder, run:

```
py rename_greek_to_greeklish.py
--path "D:\Music" --undo "D:\Music\greeklish_rename_log_...csv"
```

Type UNDO to confirm. Missing files and occupied original names are skipped, not overwritten. Undo is best before further moves or manual renames.

Useful command-line options

--dry-run — Preview without changes.

--recursive — Include subdirectories.

--no-recursive — Scan selected folder only.

--files-only — Keep folder names unchanged.

Troubleshooting

Python not found: Install Python 3.10+ and check py or python works.

Nothing to rename: Check the selected folder and subdirectory option.

Access denied: Close programs using files and check folder permissions.
